## DETAILED ACTION

### *Specification*

1. The disclosure is objected to because of the following informalities: It would be preferred that the various sections of the specification be delineated with appropriate headings.

Appropriate correction is required.

### *Claim Rejections - 35 USC § 102*

2. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

3. Claims 1-13 are rejected under 35 U.S.C. 102(b) as being by Kondoh et al(US 5,883,534).

The reference by Kondoh et al discloses a delay lock loop apparatus, see figure 1, with first delay element(B, detailed in figure 9) with input inverter 46 for delaying ORIGINAL/INPUT signal to produce ,ultimately, an output signal(OUT\_B). inverter 46 will delay the second output signal from second delay element (A, see details in figure 10 which shows the plural third delay elements and selector); the feedback is via DLL and OUT\_A. In figure 40, elements 153,154, and 155 for part of the processor that is connected to the delay and selector for allowing the proper delay(selected from output 4) to be feedback. With regards PWM, figure 37 and the description of such an embodiment is found in col. 33, lines 42-col. 8. The logic function of the set/reset gate in addition to all other elements(including first and second delay elements) allows for the PWM of Vr. In figure 45, an XOR gate (162), a

type of OR gate is shown. The OR gate receives a first signal (IN) and a second signal(OUT\_B) which is selected from a plurality of third signals developed in the delay line, see figure 9. Figure 46 shows the T/n(n=4).

The method steps being inherent.
